

# SSTIC 2016 Keynote

Brad Spengler - grsecurity

Rennes, France

June 1 2016

# Outline

- ▶ Update since PaX Team's 2012 keynote
- ▶ Advisory notice
- ▶ State of infosec union
- ▶ The future

# Update (grsecurity)

- ▶ **KSTACKOVERFLOW**
  - ▶ Kills stack overflow vuln class on 64-bit archs
- ▶ **RANDSTRUCT**
  - ▶ Randomizes layout of critical marked structures
  - ▶ Auto-randomizes pure ops structures
- ▶ **HARDEN\_IPC**
  - ▶ Automatic “umask” of sorts for IPC objects
  - ▶ Prevents harm from common cases of overly-permissive IPC
  - ▶ Based on research by Tim Brown
  - ▶ <http://labs.portcullis.co.uk/whitepapers/memory-squatting-attacks-on-system-v-shared-memory/>

# Update (grsecurity)

- ▶ **ARM v6/7 KERNEXEC/UDEREF**
  - ▶ Provides protection equivalent to i386
  - ▶ Uses ARM domain support
- ▶ **USERCOPY improvements**
  - ▶ Message queue buffers allocated in separate slab cache
- ▶ **RAND\_THREADSTACK**
  - ▶ Response to exploit by Exodus Intel against Asterisk
- ▶ **DENYUSB**
  - ▶ Prevents recognition of all new USB devices after system boot
  - ▶ Or temporary allowance via sysctl toggle

# Update (grsecurity)

- ▶ Various “smaller” features/improvements
  - ▶ DEVICE\_SIDECHANNEL
  - ▶ CHROOT\_RENAME
  - ▶ Limiting \*at() use in chroot to descendants of dir fd
    - ▶ Based on report by Jann Horn

# Update (PaX)

- ▶ Per-slab object sanitization
  - ▶ Contributed by Mathias Krause
- ▶ CONSTIFY improvements
- ▶ SIZE\_OVERFLOW improvements
- ▶ STRUCTLEAK
- ▶ LATENT\_ENTROPY improvements
  - ▶ Feeds boot-time RAM contents into entropy pool
  - ▶ After-boot entropy extraction (interrupt/fork codeflow etc)
- ▶ REFCOUNT improvements
  - ▶ Non-public plugin to automate discovery of FPs
  - ▶ PPC port by Rodrigo Branco
- ▶ UDEREF/x64 improvement
  - ▶ PCID enhancement

# Update (PaX)

- ▶ RAP
  - ▶ Just launched limited form in public 4.5 patch last month
  - ▶ Verification of type hash on indirect control flow transfers
  - ▶ < 1/5th total RAP size in LOC
  - ▶ Death of ROP/JOP/etc

# Advisory notice

- ▶ Very difficult for any single person to have an all-encompassing view of security
- ▶ I've worked in the industry in several capacities
  - ▶ Specifically not in internal security department or exploit development
- ▶ Following are observations over the years from perspective of:
  - ▶ Free software developer
  - ▶ Defense/technology-focused
  - ▶ Maintaining intellectual independence
- ▶ I've also invited the suggestions/feedback of several unnamed individuals in various segments of the industry whose opinions I greatly respect
- ▶ Everyone has an agenda

# State of infosec union

- ▶ Central claim: lack of critical thinking and gullibility for hype in infosec leads to poor security decisions, perverse priorities, and questionable ethics
- ▶ To deal with problems and change the current state, those problems must first be exposed

# State of infosec union

- ▶ Still obsessed with bugs in 2016 AD
- ▶ More bugs than ever
  - ▶ NSA in grandma's threat model
  - ▶ Nearly every unprivileged app now CVE-able
- ▶ Despite bug obsession, security is improving
- ▶ Memory corruption attacks trending away from generic to application-specific
- ▶ Less being done with bugs in public
  - ▶ How many exploits against current state of art vs state of art in 2000?
  - ▶ Nearly no "real" Metasploit mem corruption exploits since hacking advanced past 0x0c0c heap spray
- ▶ Every good exploit shop today has data-driven attack frameworks targeting weird machines and explicit interpreters for browsers/etc
  - ▶ For all the Project Zero talk of their individual bug finding, these guys just fuzz another bug to plug into their framework and laugh their way to the bank

# State of infosec union

- ▶ More data, less insight
  - ▶ Verizon DBIR report
  - ▶ Posting hundreds of presentations/papers online that are neither fact-checked nor understood doesn't make one a security expert
- ▶ Too many conferences, not enough quality to fill them all
  - ▶ Junk hacking
  - ▶ Plain false/misleading presentations with hyped up abstracts
- ▶ Conferences poor method of knowledge transfer
  - ▶ Good method of making audience *feel* “knowledge” transfer
  - ▶ Accept that it's basically show-and-tell, that understanding of a topic requires more than an hour, sometimes with weeks/months/years of background knowledge

# State of infosec union

- ▶ Charlatans/Captain Hindsight “thought-leaders”
- ▶ Many trying to get famous/rich quick
- ▶ Promoting bad advice to increase infosec handouts
- ▶ General infosec populace depends on “authority” to call these out
  - ▶ Not done by most until there’s already a safe bandwagon to jump on
  - ▶ Calling out hype/lies harms profiting off them
  - ▶ Isolates from rest of infosec if not playing along
  - ▶ Tone argument - nice-sounding liars are preferred
- ▶ Too much effort to expose falsehoods vs effort to create them

# State of infosec union

- ▶ Entitlements abound
  - ▶ Extortion games played by “researchers” entitled to payment for unrequested work/non-existent bug bounties
  - ▶ Leeches entitled to free everything, never contributing to anything
- ▶ Lots of “experts” talking/complaining but few people creating/publishing things of importance
- ▶ State of art is far beyond what remain largest individual threats
  - ▶ APT is fashionable, widespread threats are not
  - ▶ Political / interface issues
  - ▶ Office macros / hidden file extensions / gullible users
  - ▶ Giving apps enough rope via poor defaults, overly-expressive languages

# State of infosec union

## ▶ 2003, Bugtraq:

It's clear that "len" is a signed integer and if "len" is negative this problem will lead into an overflow since:

```
if ((tmp = (xdrs->x_handy - len)) < 0) { --> This check will be evaded!!
```

and we'll end up in:

```
memcpy(addr, xdrs->x_private, len);
```

BUT I must tell you; your argument about remote code execution does NOT seem to be correct in Solaris/SPARC (especially in rpcbind) Unless you can prove me otherwise.

memcpy() will die with a negative len (even with 0x80000000) and Sun's memcpy() implementation ain't ghetto like Free/Open/NetBSD so no cool tricks like GOBBLES' nose-job/scalp will work on it!

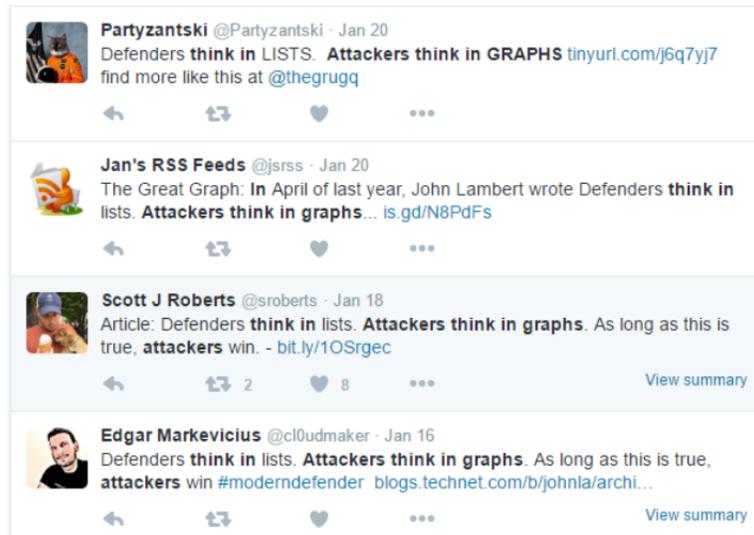

please enlighten us how come this is exploitable (Remote Code Execution in your words) ????

Regards,  
Sinan

- ▶ Lots of good technical talk happening in the open, a sense of trying to achieve a common goal

# State of infosec union

## ► 2016, Twitter

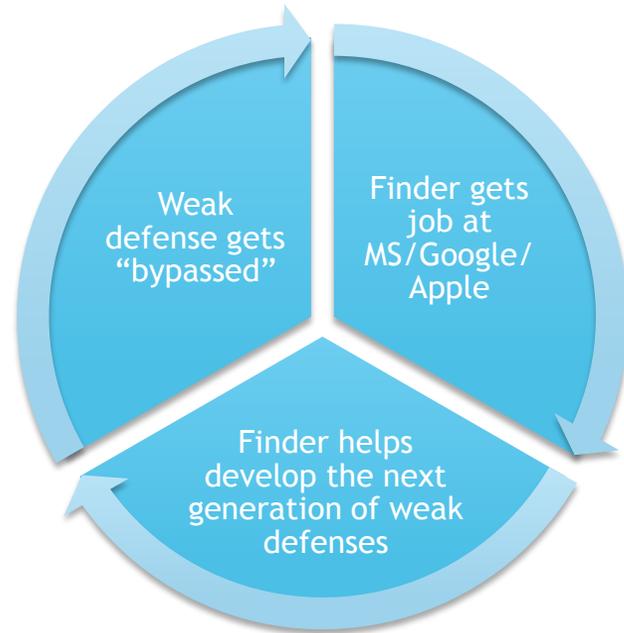

- Memes, oversimplifications, “proof” by analogy
- Strategically designed/provocatively worded to get the most attention
- Corrections/dampening expectations never as visible (e.g. BadBIOS)

# State of infosec union

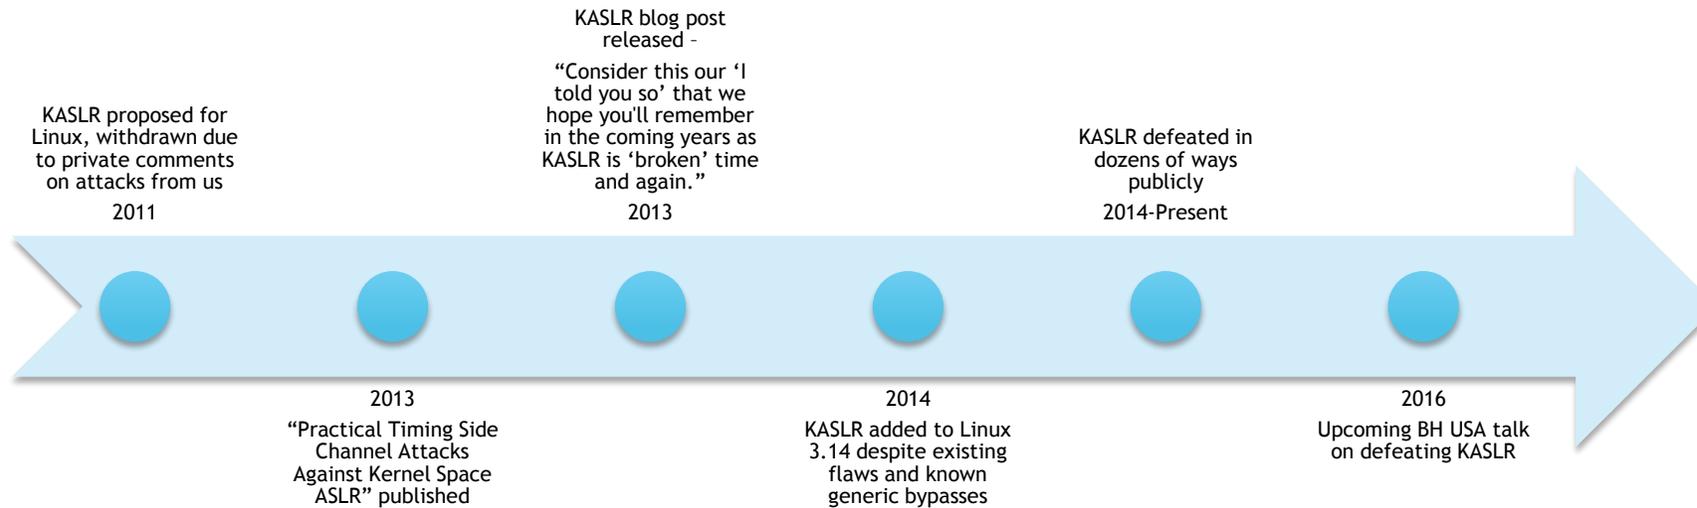

How bad assumptions lead to an industry protecting itself from its own “professionals”

# State of infosec union

Cycle of "it's better than nothing" mitigations

# State of infosec union

Ignoring security principles feeds the circus

# The future

- ▶ Have to imagine a world where current state of art in grsecurity becomes widespread
- ▶ No more arbitrary code execution, no more executing existing code out of order
- ▶ Memory corruption driven to application-specific data-only attacks on weird machines
  - ▶ <http://www.cs.dartmouth.edu/~sergey/wm/>
- ▶ Each technique more valuable than the sum of bugs killed by members of Project Zero whose names are not James Forshaw
- ▶ Necessary shift from privilege escalation to privilege abuse
- ▶ Exposing and closing these techniques will produce real security improvements

# The future

- ▶ Maybe we'll realize that there are a million different ways to add some hardening that will help against some cookie-cutter exploits
  - ▶ Doesn't mean they should be implemented - everything comes with some associated cost or tradeoff
  - ▶ One tradeoff is a false sense of security if the defense can't possibly accomplish what it's marketed for
  - ▶ Stop designing memory corruption defenses around a script kid model
- ▶ Realize if a security feature will take years to iron out all its existing bypasses or vulnerabilities introduced from new attack surface, it's not worth it
- ▶ Realize attackers take the path of least resistance
- ▶ Realize that security will never be achieved through bug reduction

# The future

- ▶ Won't fix most of the aforementioned complaints
  - ▶ Opposing motivations/rewards too great
- ▶ Can only suggest how to be a useful member of “community”
  - ▶ Critical thinking
  - ▶ Learn it's OK to say “I don't know”
  - ▶ Use valid criticism as an opportunity for improvement
  - ▶ Reject the race for fame, submit a beefy paper to a content-rich 'zine like Phrack
  - ▶ Don't seek shortcuts, put in the necessary work and learn fundamentals
  - ▶ Anyone can complain, fix something

# Questions?

- ▶ Thanks to my ~dozen reviewers/complaint contributors
- ▶ Thanks to the SSTIC committee for the invitation
- ▶ Thank you for your time!

**Pen Testeur** @pentesteur · 12h

Jeu concours #SSTIC: Posez une question à @grsecurity lors de la keynote @sstic et remportez peut être une place dans son iptables.
